

# Package ‘RLumCarlo’

May 23, 2020

**Type** Package

**Title** Monte-Carlo Methods for Simulating Luminescence Phenomena

**Version** 0.1.0

**Date** 2020-05-23

**Author** Johannes Friedrich [aut, trl] (<<https://orcid.org/0000-0002-0805-9547>>),  
Sebastian Kreutzer [aut, trl, cre] (<<https://orcid.org/0000-0002-0734-2199>>),  
Vasilis Pagonis [aut] (<<https://orcid.org/0000-0002-4852-9312>>),  
Christoph Schmidt [aut] (<<https://orcid.org/0000-0002-2309-3209>>),  
Ena Rajovic [ctb],  
Alex Roy Duncan [ctb],  
Christian Laag [ctb] (<<https://orcid.org/0000-0002-6012-1029>>)

**Maintainer** Sebastian Kreutzer <[sebastian.kreutzer@aber.ac.uk](mailto:sebastian.kreutzer@aber.ac.uk)>

**Description** A collection of functions to simulate luminescence production in dosimetric materials using Monte Carlo methods.  
Implemented are models for delocalised, localised and tunnelling transitions.  
Supported stimulation methods are TL, CW-OSL, LM-OSL, LM-IRSL, and ITL (ISO-TL).

**Contact** Package Developer Team <[sebastian.kreutzer@aber.ac.uk](mailto:sebastian.kreutzer@aber.ac.uk)>

**License** GPL-3

RLumCarlo-package	<i>Monte-Carlo Methods for Simulating Luminescence Phenomena.</i>
-------------------	---

---

## Description

A collection of functions to simulate luminescence production in dosimetric materials using Monte-Carlo methods. Implemented are models for delocalised, localised and tunnelling transitions. Supported stimulation modes are TL, CW-OSL, LM-OSL, LM-IRSL, and ITL (ISO-TL).

## Details

### Funding

The development of RLumCarlo benefited from the support by various funding bodies:

- The initial work by Johannes Friedrich, Sebastian Kreutzer and Christoph Schmidt was supported by the Deutsche Forschungsgemeinschaft (DFG, 2015–2018, SCHM 3051/4-1, "Modelling quartz luminescence signal dynamics relevant for dating and dosimetry", SCHM 3051/4-1).
- Later work (2018-2019) was secured through the project "ULTIMO: Unifying Luminescence Models of quartz and feldspar DAAD: Deutscher Akademischer Austauschdienst (German Academic Exchange Service). Framework: DAAD PPP USA 2018, ID: 57387041.
- The work of Sebastian Kreutzer as maintainer of the package was supported by LabEx LaScaArBx (ANR - n. ANR-10-LABX-52) between 2017 and 2019.
- From 2020, Sebastian Kreutzer received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 844457

Excited state luminescence signals from a random distribution of defects - A new Monte Carlo simulation approach for feldspar. *Journal of Luminescence* 207, 266–272. doi: [10.1016/j.jlumin.2018.11.024](https://doi.org/10.1016/j.jlumin.2018.11.024)

plot\_RLumCarlo

*Plot RLumCarlo Monte-Carlo Simulation Results***Description**

Visualise 'RLumCarlo' modelling results without extracting the values manually. Typically visualised are the averaged signal or the number of remaining electrons, with a polygon indicating modelling uncertainties.

**Usage**

```
plot_RLumCarlo(
  object,
  plot_uncertainty = "range",
  norm = FALSE,
  add = FALSE,
  ...
)
```

**Arguments**

object	<a href="#">list</a> of class <code>RLumCarlo_Model_Output</code> ( <b>required</b> ): input object to be plotted, usually the required input object is generated by one of the functions starting with <code>run_</code> . Alternatively a list of such objects can be provided.
plot_uncertainty	<a href="#">logical</a> ( <i>with default</i> ): type of the displayed uncertainty. Allowed values are <code>range</code> , <code>sd</code> (standard deviation) and <code>var</code> (variance). <code>NULL</code> disables the uncertainty visualisation.
norm	<a href="#">logical</a> ( <i>with default</i> ): normalise curve to the highest intensity value
add	<a href="#">logical</a> ( <i>with default</i> ): allows overplotting of results by adding curves to an existing plot. This argument is handled automatically if object is of type <a href="#">list</a>
...	further argument, that can be passed to control the plot output largely following the argument names in <a href="#">graphics::plot.default</a> . Currently supported are: <code>xlab</code> , <code>ylab</code> , <code>xlim</code> , <code>ylim</code> , <code>main</code> , <code>lwd</code> , <code>type</code> , <code>pch</code> , <code>lty</code> , <code>col</code> , <code>grid</code> , <code>legend</code> . The arguments <code>lwd</code> , <code>type</code> , <code>pch</code> , <code>lty</code> , <code>col</code> can be provided as a vector if object is a <a href="#">list</a>

**Details**

For colouring the curves, the package [khroma::khroma-package](#) is used to provide colours that can be best distinguished, in particular by colour-blind users.

**Value**

This function returns a graphical output which is the visualisation of the modelling output.

**Function version**

0.1.0

run_MC_CW_IRSL_LOC	<i>Monte-Carlo Simulation for CW-IRSL (localized transitions)</i>
--------------------	---

---

**Description**

Runs a Monte-Carlo (MC) simulation of continuous wave infrared stimulated luminescence (CW-IRSL) using the generalized one trap (GOT) model. Localized transitions refer to transitions which do not involve the conduction or valence band. These transitions take place between the ground state and an excited state of the trapped charge, and also involve an energy state of the recombination centre.

**Usage**

```
run_MC_CW_IRSL_LOC(
  A,
  times,
  clusters = 10,
  n_filled = 100,
  r,
  method = "par",
  output = "signal",
  ...
)
```

## Arguments

A	<b>numeric (required)</b> : The optical excitation rate from the ground state of the trap to the excited state ( $s^{-1}$ )
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s)
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
r	<b>numeric (with default)</b> : The retrapping ratio for localized transitions
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{LOC}(t) = -dn/dt = A * (n^2 / (r + n))$$

where in the function:

A := optical excitation rate from the ground state into the excited state of the trap ( $s^{-1}$ )

r := retrapping ratio for localized transitions

t := time (s)

n := number of filled electron traps

## Value

This function returns an object of class `RLumCarlo_Model_Output` which is a **list** consisting of an **array** with dimension `length(times) x clusters` and a **numeric** time vector.

## Function version

0.1.0

## Examples

```
run_MC_CW_IRSL_LOC(
  A = 0.12,
  times = 0:100,
  clusters = 50,
  n_filled = 100,
  r = 1e-7,
  method = "seq",
  output = "signal"
) %>%
plot_RLumCarlo(legend = TRUE)
```

---

run_MC_CW_IRSL_TUN	<i>Run Monte-Carlo Simulation for CW-IRSL (tunnelling transitions)</i>
--------------------	--

---

## Description

Runs a Monte-Carlo (MC) simulation of continuous wave infrared stimulated luminescence (CW-IRSL) using the model for tunnelling transitions. Tunnelling refers to quantum mechanical tunnelling processes from the excited state of the trap, into a recombination centre.

## Usage

```
run_MC_CW_IRSL_TUN(
  A,
  rho,
  times,
  clusters = 10,
  r_c = 0,
  delta.r = 0.1,
  N_e = 200,
  method = "seq",
  output = "signal",
  ...
)
```

## Arguments

A	<b>numeric (required)</b> : The effective optical excitation rate for the tunnelling process ( $s^{-1}$ ).
rho	<b>numeric (required)</b> : The density of recombination centres (defined as $\rho'$ in Huntley 2006) (dimensionless).
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s).
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
r_c	<b>numeric (with default)</b> : Critical distance ( $>0$ ) that must be provided if the sample has been thermally and/or optically pretreated. This parameter expresses the fact that electron-hole pairs within a critical radius $r_c$ have already recombined.
delta.r	<b>numeric (with default)</b> : Increments of the dimensionless distance parameter $r'$
N_e	<b>numeric (with default)</b> : The total number of electron traps available (dimensionless). Can be a vector of length( <code>clusters</code> ), shorter values are recycled.
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as <code>cores</code> to control the number of used CPU cores or <code>verbose</code> to silence the terminal

## Details

### The model

$$I_{TUN}(r', t) = -dn/dt = A * \exp(-(\rho')^{-1/3} * r') * n(r', t)$$

Where in the function:

A := effective optical excitation rate for the tunnelling process ( $s^{-1}$ )

$r'$  := the dimensionless tunnelling radius

$\rho'$  := rho' the dimensionless density of recombination centres (see Huntley (2006))

t := time (s)

n := the instantaneous number of electrons corresponding to the radius  $r'$  at time t

## Value

This function returns an object of class `RLumCarlo_Model_Output` which is a [list](#) consisting of an [array](#) with dimension `length(times) x length(r) x clusters` and a **numeric** time vector.

## Function version

0.2.0

plot_RLumCarlo(norm = TRUE, legend = TRUE)
```

---

run_MC_CW_OSL_DELOC	<i>Run Monte-Carlo Simulation for CW-OSL (delocalized transitions)</i>
---------------------	--

---

**Description**

Runs a Monte-Carlo (MC) simulation of continuous wave optically stimulated luminescence (CW-OSL) using the one trap one recombination centre (OTOR) model. The term delocalized here refers to the involvement of the conduction band.

**Usage**

```
run_MC_CW_OSL_DELOC(
  A,
  times,
  clusters = 10,
  N_e = 200,
```

```

    n_filled = N_e,
    R,
    method = "par",
    output = "signal",
    ...
)

```

## Arguments

A	<b>numeric (required)</b> : The optical excitation rate from trap to conduction band (s <sup>-1</sup> )
times	<b>numeric (with default)</b> : The sequence of temperature steps within the simulation (s)
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
N_e	<b>integer (with default)</b> : The total number of electron traps available (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
R	<b>numeric (with default)</b> : The retrapping ratio for delocalized transitions (dimensionless)
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : Output is either the 'signal' (the default) or 'remaining_e' (the remaining charges, electrons, in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{DELOC}(t) = -dn/dt = A * (n^2 / (N * R + n(1 - R)))$$

Where in the function:

t := time (s)

A := the optical excitation rate from trap to conduction band (1/s)

n := n\_filled, the instantaneous number of electrons

N := N\_e the available number of electron traps available

R := retrapping ratio for delocalized transitions

## Value

This function returns an object of class `RLumCarlo_Model_Output` which is a **list** consisting of an **array** with dimension length(times) x clusters and a **numeric** time vector.

```

---

run\_MC\_ISO\_DELOC

---

*Run Monte-Carlo Simulation for ISO-TL (delocalized transitions)*

---

## Description

Runs a Monte-Carlo (MC) simulation of isothermally stimulated luminescence (ISO-TL or ITL) using the one trap one recombination centre (OTOR) model. Delocalised refers to involvement of the conduction band.

## Usage

```

run_MC_ISO_DELOC(
  S,
  E,
  T = 20,
  times,
  clusters = 10,
  N_e = 200,
  n_filled = N_e,
  R,
  method = "par",
  output = "signal",
  ...
)

```

## Arguments

s	<b>numeric (required)</b> : The frequency factor of the trap ( $s^{-1}$ )
E	<b>numeric (required)</b> : Thermal activation energy of the trap (eV)
T	<b>numeric (with default)</b> : Constant stimulation temperature ( $^{\circ}\text{C}$ )
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s)
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
N_e	<b>integer (with default)</b> : The total number of electron traps available (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
R	<b>numeric (with default)</b> : The delocalized retrapping ratio (dimensionless)
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : Output is either the 'signal' (the default) or 'remaining_e' (the remaining charges, electrons, in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{DELOC}(t) = -dn/dt = (s * \exp(-E/(k_B * T_{ISO}))) * (n^2/(N * R + n(1 - R)))$$

Where in the function:

t := time

$k_B$  := Boltzmann constant ( $8.617 \times 10^{-5} \text{ eV K}^{-1}$ )

$T_{ISO}$  = temperature of the isothermal experiment ( $^{\circ}\text{C}$ )

n := n\_filled, the number of filled electron traps at the beginning of the simulation

E := the trap depth (eV)

s := the frequency factor in ( $s^{-1}$ )

N := N\_e, the total number of electron traps available (dimensionless)

R := the retrapping ratio for delocalized transitions

## Value

This function returns an object of class `RLumCarlo_Model_Output` which is a **list** consisting of an **array** with dimension `length(times) x clusters` and a **numeric** time vector.

run\_MC\_ISO\_LOC

---

*Run Monte-Carlo simulation for ISO-TL (localized transitions)*

---

**Description**

Runs a Monte-Carlo (MC) simulation of isothermally stimulated luminescence (ISO-TL or ITL) using the generalized one trap (GOT) model. Localized transitions refer to transitions which do not involve the conduction or valence band. These transitions take place between the ground state and an excited state of the trapped charge, and also involve an energy state of the recombination centre.

**Usage**

```
run_MC_ISO_LOC(
  s,
  E,
  T = 20,
  times,
  clusters = 10,
  n_filled = 100,
  r,
  method = "par",
  output = "signal",
  ...
)
```

**Arguments**

s	<b>numeric (required)</b> : The frequency factor of the trap ( $s^{-1}$ )
E	<b>numeric (required)</b> : Thermal activation energy of the trap (eV)
T	<b>numeric (with default)</b> : Constant stimulation temperature ( $^{\circ}\text{C}$ )
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s)
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
r	<b>numeric (with default)</b> : The retrapping ratio for localized transitions.
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

**Details****The model**

$$I_{LOC}(t) = -dn/dt = (s * \exp(-E/(k_B * T_{ISO}))) * (n^2/(r + n))$$

Where in the function:

t := time (s)  
 $k_B$  := Boltzmann constant ( $8.617 \times 10^{-5} \text{ eV K}^{-1}$ )  
 $T_{ISO}$  := isothermal temperature ( $^{\circ}\text{C}$ )  
n := n\_filled  
s := frequency factor of the trap ( $1/\text{s}$ )  
E := activation energy of the trap (eV)  
r := retrapping ratio for localized transitions

**Value**

This function returns an object of class `RLumCarlo_Model_Output` which is a **list** consisting of an **array** with dimension `length(times) x clusters` and a **numeric** time vector.

**Function version**

0.1.0

**How to cite**

plot_RLumCarlo(legend = TRUE)
```

---

run\_MC\_ISO\_TUN

---

*Monte-Carlo Simulation for ISO-TL (tunnelling transitions)*

---

**Description**

Runs a Monte-Carlo (MC) simulation of isothermally stimulated luminescence (ISO-TL or ITL) using the tunnelling (TUN) model. Tunnelling refers to quantum mechanical tunnelling processes from the excited state of the trapped charge, into the recombination centre.

**Usage**

```
run_MC_ISO_TUN(
  E,
  s,
  T = 200,
  rho,
  times,
  clusters = 10,
  r_c = 0,
  delta.r = 0.1,
  N_e = 200,
  method = "par",
  output = "signal",
  ...
)
```

## Arguments

E	<b>numeric (required)</b> : Thermal activation energy of the trap (eV).
s	<b>numeric (required)</b> : The effective frequency factor for the tunnelling process ( $s^{-1}$ ).
T	<b>numeric (with default)</b> : Constant stimulation temperature ( $^{\circ}\text{C}$ ).
rho	<b>numeric (required)</b> : The dimensionless density of recombination centres (defined as $\rho'$ in Huntley 2006) (dimensionless).
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s).
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
r_c	<b>numeric (with default)</b> : Critical distance ( $>0$ ) that must be provided if the sample has been thermally and/or optically pretreated. This parameter expresses the fact that electron-hole pairs within a critical radius $r_c$ have already recombined.
delta.r	<b>numeric (with default)</b> : Fractional change of the dimensionless distance of nearest recombination centres ( $r'$ )
N_e	<b>numeric (with default)</b> : The total number of electron traps available (dimensionless). Can be a vector of length( <code>clusters</code> ), shorter values are recycled.
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as <code>cores</code> to control the number of used CPU cores or <code>verbose</code> to silence the terminal

## Details

### The model

$$I_{TUN}(r', t) = -dn/dt = (s * \exp(-E/(k_B * T_{ISO}))) * \exp(-(\rho')^{-1/3} * r') * n(r', t)$$

Where in the function:

E := thermal activation energy (eV)

s := the effective frequency factor for the tunnelling process ( $s^{-1}$ )

$T_{ISO}$  := the temperature of the isothermal experiment ( $^{\circ}\text{C}$ )

$k_B$  := Boltzmann constant ( $8.617 \times 10^{-5} \text{ eV K}^{-1}$ )

$r'$  := the dimensionless tunnelling radius

$\rho$  := rho the dimensionless density of recombination centres see Huntley (2006)

t := time (s)

n := the instantaneous number of electrons corresponding to the radius  $r'$

## Value

This function returns an object of class `RLumCarlo_Model_Output` which is a [list](#) consisting of an [array](#) with dimension `length(times) x length(r) x clusters` and a [numeric](#) time vector.

run_MC_LM_OSL_DELOC	<i>Run Monte-Carlo Simulation for LM-OSL (delocalized transitions)</i>
---------------------	--

---

## Description

Runs a Monte-Carlo (MC) simulation of linearly modulated optically stimulated luminescence (LM-OSL) using the one trap one recombination centre (OTOR) model. Delocalised refers to involvement of the conduction band.

## Usage

```

run_MC_LM_OSL_DELOC(
  A,
  times,
  clusters = 10,
  N_e = 200,
  n_filled = N_e,
  R,
  method = "par",
  output = "signal",
  ...
)

```

## Arguments

A	<b>numeric (required)</b> : The optical excitation rate from trap to conduction band ( $s^{-1}$ )
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s)
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
N_e	<b>integer (with default)</b> : The total number of electron traps available (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
R	<b>numeric (with default)</b> : The retrapping ratio for delocalized transitions
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{DELOC}(t) = -dn/dt = A * t / P * (n^2 / (N * R + n(1 - R)))$$

Where in the function:

t := time (s)

A := the optical excitation rate from trap to conduction band (1/s)

n := n\_filled, the instantaneous number of electrons

R := the retrapping ratio for delocalized transitions

N := N\_e, the total number of electron traps available (dimensionless)

P := total stimulation time (s)

### Value

This function returns an object of class `RLumCarlo_Model_Output` which is a [list](#) consisting of an [array](#) with dimension `length(times) x clusters` and a [numeric](#) time vector.

run\_MC\_LM\_OSL\_LOC

*Run Monte-Carlo Simulation for LM-OSL (localized transitions)*

## Description

Runs a Monte-Carlo (MC) simulation of linearly modulated optically stimulated luminescence (LM-OSL) using the generalized one trap (GOT) model. Localized transitions refer to transitions which do not involve the conduction or valence band. These transitions take place between the ground state and an excited state of the trap, and also involve a an energy state of the recombination centre.

## Usage

```
run_MC_LM_OSL_LOC(
    A,
    times,
    clusters = 10,
    n_filled = 100,
    r,
    method = "par",
    output = "signal",
    ...
)
```

## Arguments

A	<b>numeric (required)</b> : The optical excitation rate from the ground state into the excited state of the trap ( $s^{-1}$ )
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s)
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
r	<b>numeric (with default)</b> : The retrapping ratio for localized transitions
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges, electrons, in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{LOC}(t) = -dn/dt = (A * t/P) * (n^2/(r + n))$$

Where in the function:

A := optical excitation rate from the ground state into the excited state of the trap (1/s)

P := total excitation time (s)

t := time (s)

n := n\_filled, the instantaneous number of electrons

r := the retrapping ratio for localized transitions

## Value

This function returns an object of class `RLumCarlo_Model_Output` which is a [list](#) consisting of an [array](#) with dimension `length(times) x clusters` and a [numeric](#) time vector.

```

---

run_MC_LM_OSL_TUN	<i>Run Monte-Carlo Simulation for LM-OSL (tunnelling transitions)</i>
-------------------	---

---

## Description

Runs a Monte-Carlo (MC) simulation of linearly modulated optically stimulated luminescence (LM-OSL) using the tunnelling (TUN) model. Tunnelling refers to quantum mechanical tunnelling processes from the excited state of the trapped charge, into a recombination centre.

## Usage

```

run_MC_LM_OSL_TUN(
  A,
  rho,
  times,
  clusters = 10,
  r_c = 0,
  delta.r = 0.1,
  N_e = 200,
  method = "par",
  output = "signal",
  ...
)

```

## Arguments

A	<b>numeric (required)</b> : The effective optical excitation rate for the tunnelling process
rho	<b>numeric (required)</b> : The dimensionless density of recombination centres (defined as $\rho'$ in Huntley 2006) (dimensionless)
times	<b>numeric (with default)</b> : The sequence of time steps within the simulation (s)
clusters	<b>numeric (with default)</b> : The number of MC runs
r_c	<b>numeric (with default)</b> : Critical distance (>0) that is to be used if the sample has 1 been thermally and/or optically pretreated. This parameter expresses the fact that electron-hole pairs within a critical radius r_c have already been recombined.
delta.r	<b>numeric (with default)</b> : Increments of dimensionless distance r'
N_e	<b>numeric (width default)</b> : The total number of electron traps available (dimensionless). Can be a vector of length(clusters), shorter values are recycled.

method	<b>character</b> ( <i>with default</i> ): Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character</b> ( <i>with default</i> ): output is either the 'signal' (the default) or 'remaining_e' (the remaining charges, electrons, in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{TUN}(r', t) = -dn/dt = (A * t/P) * \exp(-(\rho')^{-1/3} * r') * n(r', t)$$

Where in the function:

A := the optical excitation rate for the tunnelling process (s<sup>-1</sup>)

t := time (s)

P := maximum stimulation time (s)

r' := the dimensionless tunnelling radius

ρ := rho the dimensionless density of recombination centres see Huntley (2006)

n := the instantaneous number of electrons corresponding to the radius r'

### Value

This function returns an object of class `RLumCarlo_Model_Output` which is a **list** consisting of an **array** with dimension length(times) x length(r) x clusters and a **numeric** time vector.

---

run\_MC\_TL\_DELOC

---

*Run Monte-Carlo Simulation for TL (delocalized transitions)*

---

## Description

Runs a Monte-Carlo (MC) simulation of thermoluminescence (TL) using the one trap one recombination centre (OTOR) model. Delocalised refers to involvement of the conduction band. The heating rate in this function is assumed to be 1 K/s.

## Usage

```
run_MC_TL_DELOC(
  s,
```

```

    E,
    times,
    b = 1,
    clusters = 10,
    N_e = 200,
    n_filled = N_e,
    R = 1,
    method = "par",
    output = "signal",
    ...
)

```

## Arguments

s	<b>numeric (required)</b> : The frequency factor of the trap (s <sup>-1</sup> )
E	<b>numeric (required)</b> : Thermal activation energy of the trap (eV)
times	<b>numeric (with default)</b> : The sequence of temperature steps within the simulation (s). The default heating rate is set to 1 K/s. The final temperature is max(times) * b
b	<b>numeric (with default)</b> : the heating rate in K/s
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
N_e	<b>integer (with default)</b> : The total number of electron traps available (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
R	<b>numeric (with default)</b> : Re-trapping ratio for delocalized transitions
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{DELOC}(t) = -dn/dt = (s * \exp(-E/(k_B * T))) * (n^2/(N * R + n(1 - R)))$$

Where in the function:

E := the thermal activation energy (eV)

s := the frequency factor in (s<sup>-1</sup>)

t := time (s)

k<sub>B</sub> := Boltzmann constant (8.617 x 10<sup>-5</sup> eV K<sup>-1</sup>)

T := temperature (°C)

R := Delocalised retrapping ratio

n := n\_filled, the instantaneous number of electrons

$N := N_e$ , the total number of electron traps available (dimensionless)

### Why times and b instead of temperature?

The parameter to control the temperature is a function of the stimulation times (the parameter times) and the heating rate (b). Thus, the final temperature is  $\max(\text{times}) * b$ . For a heating rate ( $b = 1$ ) the final temperature is  $\max(\text{times})$ . While this might be a little bit confusing, it also allows you to control the time resolution of the simulation, i.e. you can simulate more points per second.

### Value

This function returns an object of class `RLumCarlo_Model_Output` which is a [list](#) consisting of an [array](#) with dimension  $\text{length}(\text{times}) \times \text{clusters}$  and a [numeric](#) time vector.

  bty = "n",
  title = "parameters",
  legend = c(
    paste0("E = ", E),
    paste0("s = ", s),
    paste0("n_filled = ", n_filled),
    paste0("N_e = ", N_e), paste0("R = ", R)),
  text.col = col)

## End(Not run)

```

## Description

Runs a Monte-Carlo (MC) simulation of thermoluminescence (TL) using the generalized one trap (GOT) model. Localized transitions refer to transitions which do not involve the conduction or valence band. These transitions take place between the ground state and an excited state of the trapped charge, and also involve an energy state of the recombination centre. The heating rate in this function is assumed to be 1 K/s.

## Usage

```
run_MC_TL_LOC(
    s,
    E,
    times,
    b = 1,
    clusters = 10,
    n_filled = 100,
    r,
    method = "par",
    output = "signal",
    ...
)
```

## Arguments

s	<b>numeric (required)</b> : The frequency factor of the trap (s <sup>-1</sup> )
E	<b>numeric (required)</b> : Thermal activation energy of the trap (eV)
times	<b>numeric (with default)</b> : The sequence of temperature steps within the simulation (s). The default heating rate is set to 1 K/s. The final temperature is max(times) * b
b	<b>numeric (with default)</b> : the heating rate in K/s
clusters	<b>numeric (with default)</b> : The number of created clusters for the MC runs
n_filled	<b>integer (with default)</b> : The number of filled electron traps at the beginning of the simulation (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
r	<b>numeric (with default)</b> : The localized retrapping ratio (dimensionless)
method	<b>character (with default)</b> : Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character (with default)</b> : output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{LOC}(t) = -dn/dt = (s * \exp(-E/(k_B * T))) * (n^2/(r + n))$$

Where in the function:

$E$  := the thermal activation energy (eV)

$s$  := the frequency factor for the trap ( $s^{-1}$ )

$t$  := time (s)

$k_B$  := Boltzmann constant ( $8.617 \times 10^{-5}$  eV  $K^{-1}$ )

$T$  := temperature ( $^{\circ}C$ )

$n$  := the instantaneous number of electrons

$r$  := the retrapping ratio for localized transitions

## Value

This function returns an object of class `RLumCarlo_Model_Output` which is a [list](#) consisting of an [array](#) with dimension `length(times) x clusters` and a [numeric](#) time vector.

## Function version

0.1.0

## plot
plot_RLumCarlo(results)

## End(Not run)

```

run\_MC\_TL\_TUN

*Run Monte-Carlo Simulation for TL (tunnelling transitions)*

## Description

Runs a Monte-Carlo (MC) simulation of thermoluminescence (TL) caused by tunnelling (TUN) transitions. Tunnelling refers to quantum mechanical tunnelling processes from the excited state of the trap into a recombination centre. The heating rate in this function is assumed to be 1 K/s.

## Usage

```

run_MC_TL_TUN(
  s,
  E,
  rho,
  r_c = 0,
  times,
  b = 1,
  clusters = 10,
  N_e = 200,
  delta.r = 0.1,
  method = "par",
  output = "signal",
  ...
)

```

## Arguments

s	<b>list (required)</b> : The effective frequency factor for the tunneling process ( $s^{-1}$ )
E	<b>numeric (required)</b> : Thermal activation energy of the trap (eV)
rho	<b>numeric (required)</b> : The dimensionless density of recombination centers (defined as $\rho'$ in Huntley 2006)
r_c	<b>numeric (with default)</b> : Critical distance ( $>0$ ) that is to be used if the sample has been thermally and/or optically pretreated. This parameter expresses the fact that electron-hole pairs within a critical radius $r_c$ have already recombined.
times	<b>numeric (with default)</b> : The sequence of temperature steps within the simulation (s). The default heating rate is set to 1 K/s. The final temperature is $\max(\text{times}) * b$
b	<b>numeric (with default)</b> : the heating rate in K/s

clusters	<b>numeric</b> (with default): The number of created clusters for the MC runs
N_e	<b>numeric</b> (with default): The total number of electron traps available (dimensionless). Can be a vector of length(clusters), shorter values are recycled.
delta.r	<b>numeric</b> (with default): The increments of the dimensionless distance $r'$
method	<b>character</b> (with default): Sequential 'seq' or parallel 'par' processing. In the parallel mode the function tries to run the simulation on multiple CPU cores (if available) with a positive effect on the computation time.
output	<b>character</b> (with default): output is either the 'signal' (the default) or 'remaining_e' (the remaining charges/electrons in the trap)
...	further arguments, such as cores to control the number of used CPU cores or verbose to silence the terminal

## Details

### The model

$$I_{TUN}(r', t) = -dn/dt = (s * \exp(-E/(k_B * T))) * \exp(-(\rho')^{-1/3} * r') * n(r', t)$$

Where in the function:

$s$  := frequency for the tunneling process ( $s^{-1}$ )

$E$  := thermal activation energy (eV)

$k_B$  := Boltzmann constant ( $8.617 \times 10^{-5}$  eV K $^{-1}$ )

$T$  := temperature (°C)

$r'$  := the dimensionless tunneling radius

$\rho'$  := rho', the dimensionless density of recombination centres (see Huntley (2006))

$t$  := time (s)

$n$  := the instantaneous number of electrons at distance  $r'$

### Value

This function returns an object of class `RLumCarlo_Model_Output` which is a **list** consisting of an **array** with dimension `length(times) x length(r) x clusters` and a **numeric** time vector.
